

## CTI BioPharma Announces Presentation of New Anemia Benefit Data from Pacritinib Program at the Society of Hematologic Oncology (SOHO) Tenth Annual Meeting

September 21, 2022

SEATTLE, Sept. 21, 2022 /PRNewswire/ -- CTI BioPharma Corp. (NASDAQ: CTIC) today announced two poster presentations from the Company's pacritinib program at the Society of Hematologic Oncology (SOHO) Tenth Annual Meeting, to be held in Houston, Texas and virtually September 28 – October 1, 2022.

A new data analysis from the Phase 3 PERSIST-2 trial and an *in vitro* analysis of pacritinib, a novel JAK2/IRAK1 inhibitor approved by the U.S. FDA for patients with myelofibrosis and a platelet count below  $50 \times 10^9/L$ , will highlight pacritinib's impact on anemia and inhibition of Activin A receptor type 1 (ACVR1).

"Treatment with pacritinib at the approved dose of 200 mg twice daily (BID) led to improvements in transfusion independence and anemia when compared to best available therapy (BAT) in patients treated on the PERSIST-2 Phase 3 study," said Dr. Stephen Oh, MD, PhD, Associate Professor of Medicine, Hematology Division at Washington University School of Medicine in St. Louis. "I am encouraged by these data, given the limited options to address anemia in myelofibrosis, especially high-risk patients with cytopenias who frequently require blood transfusions. I look forward to further investigation of pacritinib's potential to alleviate anemia and related symptoms in this patient population."

"We are pleased to report that pacritinib is a highly potent inhibitor of ACVR1. This inhibition is thought to lead to improvements in blood transfusion requirements and anemia in patients with cytopenic myelofibrosis," said Adam Craig, MD, PhD, President and Chief Executive Officer of CTI BioPharma. "The data presented at SOHO 2022 support our belief that pacritinib is a simple, safe and effective JAK2 inhibitor. We plan to present additional data on pacritinib's anemia benefit at a medical meeting later this year."

Presentation materials will be available at [ctibiopharma.com](http://ctibiopharma.com).

### Retrospective Analysis of Anemia Benefit of Pacritinib from the PERSIST-2 Trial

**Abstract Number:** MPN-145

**Session Name:** Poster Session

**Session Date:** Wednesday, September 28

**Presentation Time:** 5:05-6:30 p.m. CDT (06:05-7:30 p.m. EDT)

**Presenter:** Dr. Stephen Oh

Pacritinib is a novel JAK2/IRAK1 inhibitor approved by the U.S. Food and Drug Administration (FDA) for patients with myelofibrosis and severe thrombocytopenia (platelet count  $<50 \times 10^9/L$ ). Previous clinical trials have noted improvements in spleen volume and symptom scores, as well as improvement in anemia and a decline in transfusion burden. A retrospective analysis of the Phase 3 PERSIST-2 trial was conducted to further assess pacritinib's impact on anemia, and an *in vitro* analysis was performed to explore pacritinib's inhibition of Activin A receptor type 1 (ACVR1; also known as activin receptor-like kinase 2 [ALK2]).

On duplicate assays, pacritinib was shown to be a more potent inhibitor of ACVR1 compared to momelotinib, with a half maximal inhibitory concentration ( $IC_{50}$ ) of 10.8 and 22.6 nM versus 34.9 and 70.2 nM, respectively. The percentage of patients who achieved transfusion independence over any 12-week intervals through week 24 was greater on pacritinib 200 mg twice daily than best available therapy (27% vs 5%), among evaluable non-transfusion independent patients (defined as any red blood cell transfusions in 90 days prior to the first dose or a baseline hemoglobin  $<8$  g/dL). These data suggest an important role for pacritinib in addressing anemia in patients with myelofibrosis.

### Retrospective Comparison of Patient Outcomes on Pacritinib Versus Ruxolitinib in Patients with Myelofibrosis (MF) and Thrombocytopenia (encore)

**Abstract Number:** MPN-141

**Session Name:** Poster Session

**Session Date:** Wednesday, September 28

**Presentation Time:** 5:05-6:30 p.m. CDT (06:05-7:30 p.m. EDT)

**Presenter:** Dr. Prithviraj Bose

Pacritinib is a novel JAK2/IRAK1 inhibitor approved by the U.S. FDA for patients with myelofibrosis and severe thrombocytopenia (platelet count  $<50 \times 10^9/L$ ). Unlike the JAK 1/2 inhibitor ruxolitinib, which must be dose-reduced or held in patients with thrombocytopenia, pacritinib has been studied at full dose regardless of platelet count. This retrospective analysis reported on the outcomes in patients treated with pacritinib versus ruxolitinib in the Phase 3 PERSIST-2 study. Patients were randomized 1:1:1 to pacritinib 200 mg BID, pacritinib 400 mg once daily (QD) or BAT, with 45 percent of patients on BAT receiving ruxolitinib.

Results show that pacritinib, administered at the full dose of 200 mg BID, yielded higher response rates and a similar safety profile compared to lower-dose ruxolitinib in patients with myelofibrosis who have moderate or severe thrombocytopenia.

### About VONJO (pacritinib)

Pacritinib is an oral kinase inhibitor with activity against wild type Janus Associated Kinase 2 (JAK2), mutant JAK2<sup>V617F</sup> form and FMS-like tyrosine kinase 3 (FLT3), which contribute to signaling of a number of cytokines and growth factors that are important for hematopoiesis and immune function. Myelofibrosis is often associated with dysregulated JAK2 signaling. Pacritinib has higher inhibitory activity for JAK2 over other family members, JAK3 and TYK2. At clinically relevant concentrations, pacritinib does not inhibit JAK1. Pacritinib exhibits inhibitory activity against additional cellular kinases (such as CSF1R and IRAK1), the clinical relevance of which is unknown.

VONJO is indicated for the treatment of adults with intermediate or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis with a platelet count below  $50 \times 10^9/L$ . This indication is approved under accelerated approval based on spleen volume reduction. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s).

### **Important VONJO Safety Information**

#### **Hemorrhage:**

Serious (11%) and fatal (2%) hemorrhages have occurred in VONJO-treated patients with platelet counts  $<100 \times 10^9/L$ . Serious (13%) and fatal (2%) hemorrhages have occurred in VONJO-treated patients with platelet counts  $<50 \times 10^9/L$ . Grade  $\geq 3$  bleeding events (defined as requiring transfusion or invasive intervention) occurred in 15% of patients treated with VONJO compared to 7% of patients treated on the control arm. Due to hemorrhage, VONJO dose reductions, dose interruptions, or permanent discontinuations occurred in 3%, 3%, and 5% of patients, respectively.

Avoid use of VONJO in patients with active bleeding and hold VONJO seven days prior to any planned surgical or invasive procedures. Assess platelet counts periodically, as clinically indicated. Manage hemorrhage using treatment interruption and medical intervention.

#### **Diarrhea:**

VONJO causes diarrhea in approximately 48% of patients compared to 15% of patients treated on the control arm. The median time to resolution in VONJO-treated patients was two weeks. The incidence of reported diarrhea decreased over time, with 41% of patients reporting diarrhea in the first eight weeks of treatment, 15% in weeks 8 through 16, and 8% in weeks 16 through 24. Diarrhea resulted in treatment interruption in 3% of VONJO-treated patients. None of the VONJO-treated patients reported diarrhea that resulted in treatment discontinuation. Serious diarrhea adverse reactions occurred in 2% of patients treated with VONJO compared to no such adverse reactions in patients in the control arm.

Control pre-existing diarrhea before starting VONJO treatment. Manage diarrhea with antidiarrheal medications, fluid replacement, and dose modification. Treat diarrhea with antidiarrheal medications promptly at the first onset of symptoms. Interrupt or reduce VONJO dose in patients with significant diarrhea despite optimal supportive care.

#### **Thrombocytopenia:**

VONJO can cause worsening thrombocytopenia. VONJO dosing was reduced due to worsening thrombocytopenia in 2% of patients with pre-existing moderate to severe thrombocytopenia (platelet count  $<100 \times 10^9/L$ ). VONJO dosing was reduced due to worsening thrombocytopenia in 2% of patients with pre-existing severe thrombocytopenia (platelet count  $<50 \times 10^9/L$ ).

Monitor platelet count prior to VONJO treatment and as clinically indicated during treatment. Interrupt VONJO in patients with clinically significant worsening of thrombocytopenia that lasts for more than seven days. Restart VONJO at 50% of the last given dose once the toxicity has resolved. If toxicity recurs hold VONJO. Restart VONJO at 50% of the last given dose once the toxicity has resolved.

#### **Prolonged QT interval:**

VONJO can cause prolongation of the QTc interval. QTc prolongation of  $>500$  msec was higher in VONJO-treated patients than in patients in the control arm (1.4% vs 1%). QTc increase from baseline by 60 msec or higher was greater in VONJO-treated patients than in control arm patients (1.9% vs 1%). Adverse reactions of QTc prolongation were reported for 3.8% of VONJO-treated patients and 2% of control arm patients. No cases of torsades de pointes were reported.

Avoid use of VONJO in patients with a baseline QTc of  $>480$  msec. Avoid use of drugs with significant potential for QTc prolongation in combination with VONJO. Correct hypokalemia prior to and during VONJO treatment. Manage QTc prolongation using VONJO interruption and electrolyte management.

#### **Major Adverse Cardiac Events (MACE):**

Another JAK-inhibitor has increased the risk of MACE, including cardiovascular death, myocardial infarction, and stroke (compared to those treated with TNF blockers) in patients with rheumatoid arthritis, a condition for which VONJO is not indicated.

Consider the benefits and risks for the individual patient prior to initiating or continuing therapy with VONJO, particularly in patients who are current or past smokers and patients with other cardiovascular risk factors. Patients should be informed about the symptoms of serious cardiovascular events and the steps to take if they occur.

#### **Thrombosis:**

Another JAK-inhibitor has increased the risk of thrombosis, including deep venous thrombosis, pulmonary embolism, and arterial thrombosis (compared to those treated with TNF blockers) in patients with rheumatoid arthritis, a condition for which VONJO is not indicated.

Patients with symptoms of thrombosis should be promptly evaluated and treated appropriately.

#### **Secondary Malignancies:**

Another JAK-inhibitor has increased the risk of lymphoma and other malignancies, excluding non-melanoma skin cancer (NMSC) (compared to those treated with TNF blockers), in patients with rheumatoid arthritis, a condition for which VONJO is not indicated. Patients who are current or past smokers are at additional increased risk.

Consider the benefits and risks for the individual patient prior to initiating or continuing therapy with VONJO, particularly in patients with a known malignancy (other than a successfully-treated NMSC), patients who develop a malignancy, and patients who are current or past smokers.

#### **Risk of Infection:**

Another JAK-inhibitor has increased the risk of serious infections compared to best available therapy (BAT) in patients with myeloproliferative

neoplasms. Serious bacterial, mycobacterial, fungal and viral infections may occur in patients treated with VONJO. Delay starting therapy with VONJO until active serious infections have resolved. Observe patients receiving VONJO for signs and symptoms of infection and manage promptly. Use active surveillance and prophylactic antibiotics according to clinical guidelines.

**Interactions with CYP3A4 Inhibitors or Inducers:**

Co-administration of VONJO with strong CYP3A4 inhibitors or inducers is contraindicated. Avoid concomitant use of VONJO with moderate CYP3A4 inhibitors or inducers.

Drug interruptions due to an adverse reaction occurred in 27% patients who received VONJO 200 mg twice daily compared to 10% of patients treated with BAT. Dosage reductions due to an adverse reaction occurred in 12% of patients who received VONJO 200 mg twice daily compared to 7% of patients treated with BAT. Permanent discontinuation due to an adverse reaction occurred in 15% of patients receiving VONJO 200 mg twice daily compared to 12% of patients treated with BAT.

**About Myelofibrosis**

Myelofibrosis is bone marrow cancer that results in formation of fibrous scar tissue and can lead to thrombocytopenia and anemia, weakness, fatigue and an enlarged spleen and liver. Within the United States, there are approximately 21,000 patients with myelofibrosis, 7,000 of which have severe thrombocytopenia (defined as blood platelet counts of less than  $50 \times 10^9/L$ ). Severe thrombocytopenia is associated with poor survival and high symptom burden and can occur as a result of disease progression or from drug toxicity with other JAK2 inhibitors, such as JAKAFI and INREBIC.

**About CTI BioPharma Corp.**

We are a commercial biopharmaceutical company focused on the acquisition, development and commercialization of novel targeted therapies for blood-related cancers that offer a unique benefit to patients and their healthcare providers. CTI has one FDA-approved product, VONJO<sup>®</sup> (pacritinib), a JAK2 and IRAK1 inhibitor, that spares JAK1. VONJO is approved for the treatment of adults with intermediate- or high-risk primary or secondary (post-polycythemia vera or post-essential thrombocythemia) myelofibrosis with a platelet count below  $50 \times 10^9/L$ . This indication is approved under FDA accelerated approval based on spleen volume reduction. Continued approval for this indication may be contingent upon verification and description of clinical benefit in a confirmatory trial(s). CTI is conducting the Phase 3 PACIFICA study of VONJO in patients with myelofibrosis and severe thrombocytopenia as a post-marketing requirement.

VONJO<sup>®</sup> is a registered trademark of CTI BioPharma Corp.

**Forward-Looking Statements**

Statements included in this press release that are not historical in nature are forward-looking statements within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934, and the Private Securities Litigation Reform Act of 1995. These forward-looking statements are based on current assumptions that involve risks, uncertainties and other factors that may cause the actual results, events or developments to be materially different from those expressed or implied by such forward-looking statements. These risks and uncertainties include, but are not limited to: our ability to successfully commercialize VONJO and generate future revenues with respect to VONJO; our limited experience in generating revenue from product sales; the accuracy of our assumptions regarding our planned expenditures and sufficiency of our cash to fund operations; risks and uncertainties related to the COVID-19 pandemic as it relates to our operations and ongoing clinical trials; plans to present additional data on pacritinib's anemia benefit at later scientific conferences or in scientific journals; and those risks more fully discussed in the section entitled "Risk Factors" in our Annual Report on Form 10-K for the year ended December 31, 2021 and subsequent quarterly reports on Form 10-Q. These forward-looking statements speak only as of the date hereof and we assume no obligation to update these forward-looking statements, and readers are cautioned not to place undue reliance on such forward-looking statements.
